

Teachers and students benefit from clear communication.  
Students will get better results.

Sound field systems can help engage students, improve attentiveness to the teacher, build learning success, reduce the achievement gap, foster control and orderliness, improve test scores, and reduce vocal strain and fatigue for teachers.

Numerous studies show that classrooms using soundfield enjoy better student comprehension, increased student participation, better grades and fewer behavioural referrals.

Without Soundfield system pupils can find it hard to hear the teacher towards the back of the room. Noise from other pupils easily masks the teachers voice. With Sounfield every pupil hears the teachers voice at the same level making it easier to concentrate.

### How the system works

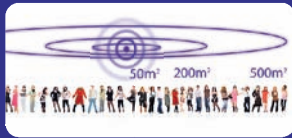

The teacher wears a wireless microphone and speaks at a normal level. The microphone transmits the voice to a receiver/amplifier and from here it is sent to speakers placed to give even coverage throughout the room.

Speakers can be either wired to the amplifier, or a wireless version is available enabling installation without the need to run speaker cables. For even more versatility, a portable version is available taking sound to where it is needed.
